# The Clip System

To attach the screen just slide the clip over the carriage bolt, and snug down the strap. If your system has the bolts screwed flush with the surface, unscrew the bolt about 1/8" then slide the clips on.

If your system has the bolts removed and the inserts are secured with covers, remove the covers and install the carriage bolt. Screw down to within 1/8" of the surface. Slide the clip over the bolt and snug down the strap.

**The clip cannot rest on the threads!**

**Make sure the clip rests on the square shank behind the round head.**

See the page on tightening straps and locking buckles to ensure your system performs to specifications.

# Removing Stainless Steel Caps & Installing Hooks

If you are using the stainless steel caps, use a standard flat head screwdriver to remove them. If you are using the white nylon caps, use a #3 phillips head screw driver to remove the cap.

Once the bolts are removed, install the eye bolts. Be sure to fully thread these types of hardware.

Eye Bolts should tighten 5 full turns into the anchor and the open end **MUST** face the weather side.

# Threading the Buckles and Straps

The strap enters the buckle from the back in to the top slot.

**NOTE: On standard screens, the flap will cover the front of the buckle. Please lift the flap and proceed with threading the buckle.**

It then continues down the front of the buckle and back through the bottom slot.

# Attaching Buckles

The buckles on the screen are deployed by looping the strap through the eyebolt, up behind the buckle, through the top slot from behind, then down through the bottom slot from the front side. The straps may be easily tightened by holding the strap and stepping on it.

**NOTE: Depending on the screen style, a flap may cover the front of the buckle. Please lift the flap and proceed with locking the buckle.**

## TIGHTENING STRAPS

Pull the Strap Tight.

Pull back against Buckle.

Repeat this process until the strap is tight. The screen should still have some play after tightening

# Locking the Buckle

1. First thread the strap through the back and center of buckle.

2. Next bring loop through lower opening down through front of buckle.

3. Now tighten strap down to anchor point.

**DO NOT OVER TIGHTEN**

4. Then you will feed hanging strap through center of buckle from front.

5. Finally pull tail through back and pull tight.

**NOTE: Depending on the screen style, a flap may cover the front of the buckle. Please lift the flap and proceed with locking the buckle.**

**It is extremely important to lock the buckle like this. High pulsating winds will loosen unlocked buckles.**

**To release the tension on the buckle and strap, simply give a slight tug on the buckle similar to releasing a safety belt on an airplane seat.**
